

HUMIDIFICATION DEVICES

Automatic humidification devices controlled by automation systems are typically used to maintain quality and preserve the importance of moisture content. These devices are particularly used in cold storage rooms conditioned to positive temperatures where stored products can suffer from moisture loss, leading to reduced quality and moisture content. By controlling the humidity level of cold rooms, automatic humidification devices can also assist in the cooling process through the heat exchange that occurs during evaporation.

FEATURES

Easy installation (connect to a water faucet or water tank).

Various area of use (on a wall).

Easy to carry with a handle.

Smooth and simple structure (high durability).

Good for chemical disinfection, ion and odor removal.

Easy adaptation to automation systems.
